

## Walking for Water with the Missions

Not everyone in the world has access to clean drinking water. In the missions, many people walk for hours every day to get water and then carry it back home. Can you find the water to bring back to your family?

The average person walks at a speed of 2.5 miles per hour. Some people have to walk that distance every day to get water. This uses approximately 2 hours of their day.

Did it take you about 5 minutes to complete this puzzle? If so, in that time you would have walked 1,100 feet to get water. Could you carry a full bucket of water that far? Try it in your parking lot and collect 10 cents for the missions for every foot you can carry the bucket!
